Tokyo Electric Power Company Holdings, Inc.

On October 20, from 6 a.m. to 7 a.m., the examination of the interior of the Units 1 and 2 exhaust stack was carried out using drones. Because a structure, which looked like a beam, was found at the point about 10-20m below the top of the stack, no further measurement of radiation dose will be conducted inside the exhaust stack. Instead, the dose will be simulated from the measurement results obtained from outside of the stack.
