<sup>·</sup> ND indicates that analysis result is less than the detection limit.

For example, "3.1E+01" means "3.1×101" and equals 31. Similarly, "3.1E+00" means "3.1×100" and equals 3.1, and "3.1E-01" means "3.1×101" and equals 0.31.

Measurement - The concentrations of each radionuclide have been calculated by directly measuring/analyzing radioactivity intensity and the quantity of the element.

Gross Alpha - The total amount of alpha-radionuclides in the specimen are calculated by directly measuring alpha rays.

Radioactive Equilibrium Assessment - Calculated using a physical phenomenon in which the amount of radioactivity of one radionuclide and another radionuclide produced by the decay of that radionuclide exist in a certain ratio. Relative Ratio Assessment - Calculated based on the assessment values of radionuclides that existed inside the reactor while considering radionuclide decay and migration into ALPS treated water.

Values are expressed in exponential notation.

<sup>\*1 &</sup>quot;Uncertainty" refers to the accuracy of analysis data.

<sup>&</sup>quot;Uncertainty" is calculated using "Expanded Uncertainty: Coverage Factor k=2".

<sup>\*2</sup> Regulatory concentration limits stipulated in the Regulations of the Safety and Physical Protection of Specific Nuclear Fuel Material at Fukushima Daiichi Nuclear Power Station of the Tokyo Electric Power Company, Incorporated.

(Attached Chart 1, Row 6: Concentration limits in the water outside of the environmental monitoring area [in this chart Bq/cm³ has been converted into Bq/L])

<sup>\*3</sup> The ratio to regulatory concentration limit for alpha-radionuclides has been assessed using the lowest regulatory concentration limit for all the target nuclides.

<sup>\*4</sup> Analysis methods are as follows:

Measurement - The concentration of radionuclide has been calculated by directly measuring/analyzing radioactivity intensity and the quantity of the element.

<sup>\*1 &</sup>quot;Uncertainty" refers to the accuracy of analysis data.

<sup>&</sup>quot;Uncertainty" is calculated using "Expanded Uncertainty: Coverage Factor k=2".

<sup>\*2</sup> To confirm that the tritium concentration is less than 1E+06Bq/liter (less than 1 million Bq/liter), the maximum concentration stipulated in the implementation plan, ensuring that the tritium concentration after dilution is less than 1,500 Bq/liter.

\*1 "O" indicates that the absence of significant concentrations was confirmed by the following, and "x" indicates that significant concentrations of nuclide was confirmed.

<sup>-</sup> For nuclide that has been assessed using radioactive equilibrium, etc., if its target nuclide is detected and the assessment value of the target nuclide is extremely small compared to the regulatory concentration limit, or in other words, if it is less than 1/100 of the regulatory concentration limit which is the value set as the detection limit, then it shall be deemed to be below the detection limit.
