Situation of Storage and Treatment of Accumulated Water containing Highly Concentrated Radioactive Materials at Fukushima Daiichi Nuclear Power Station (474th Release)

October 26, 2020 Tokyo Electric Power Company Holdings, Inc.

1. Introduction

This document is to report the following matters in accordance with the instruction of "Installment of treatment facility and storing facility of water containing highly concentrated radioactive materials at Fukushima Daiichi Nuclear Power Station of the Tokyo Electric Power Company (Instruction) "(NISA No. 6, June 8, 2011), dated on June 9, 2011.

<Instruction>

TEPCO should report to NISA the situation of storing and treatment of the contaminated water in the Power Station and the future forecast based upon the current situation has to be reported to NISA as soon as the treatment facility starts its operation. Also, subsequently, continued report has to be submitted to NISA once a week until the treatment of the accumulated water in the Central Radioactive Waste Treatment Facility is completed.

2. Situation of storing and treatment of accumulated water in the building (actual record)

Stored amounts in each unit building (Units 1 to 4 (including condensers and trenches)) and stored and treated amounts, and other related data in the Accumulated Water Storing Facility as of October 22, 2020 are shown in the Attachment -1.

3. Forecast of storing and treatment

(1) Short term forecast

Water transfer in Units 1 and 2 and Units 3 and 4 is planned based on the stored amount in the Accumulated Water Storing Facilities and the operating situation of the radioactive material treatment equipment and the subdrain catchment facility. Water is transferred to the Process Main Building and/or High Temperature Incinerator Building as Accumulated Water Storing Facilities.

Treatment is implemented considering the state of storage and transfer of Accumulated Water Storing Facilities.

We assume stored amounts in each unit building (Units 1 to 4 (including condenser and trench)), and stored and treated amounts, and other related data in the Accumulated Water Storing Facilities as of October 29, 2020 are shown in Attachment -2.

1

(2) Middle term forecast

Regarding accumulated water in Units 1 and 2 buildings and Units 3 and 4 buildings, from the viewpoint of reducing the risks of discharging to the ocean and leaking into the groundwater, it is necessary to keep enough capacity for the accumulated water in the building until its level reaches TP. 2,564 and to keep the accumulated water level lower than the groundwater level.

On the other hand, based on the view of limiting inflow of underwater to buildings and reducing the amount of emerged accumulated water, we are planning to transfer accumulated water keeping specific water-level difference between accumulated water in the building around and subdrain water and making the lowest floor surface of buildings other than Units 1 to 3 reactor buildings where circulating water is injected into exposed by 2020.

As for accumulated water of the Process Main Building and the High Temperature Incinerator Building, we are planning to treat the accumulated water considering the situation of construction of middle and low level waste water tanks, the operation factor of the radioactive material treatment instruments and duration for maintenance.

We forecast stored amounts in each unit building (Units 1 to 4 (including condensers and trenches)), and storing and treatment situations in the Accumulated Water Storing Facilities for the next 3 months, as shown in Attachment -3.

Stored amounts in each building and the water storage equipment are forecasted to be unchanged in case transfer and treatment were implemented as scheduled without rain. However, it would be subject to change depending on the operation factor of the radioactive material treatment instruments and so on.

Also, the water treated at the radioactive material treatment equipment (fresh water and condensed salt water) can be stored in the middle and low level waste water tanks.

END

Attachment-1

Storage and treatment of high level radioactive accumulated water (as of October 22, 2020)

Approx.8,370

T.P.-1,609

T.P. -1.479

Water transfer from the Units 1-4 to the buildings (Units 1-4, Centralized radioactive waste treatment facilities) and to the treatment facilities was

Due to other works, water transfer to the buildings (Units 1-4, Centralized radioactive waste treatment facilities) was conducted whenever necessary.

From October 15, operations of the 2nd Cesium Adsorption Apparatus have been resumed; the availability factor is 38% (previous simulated : 40%).

Under

Main operations that have been conducted during the period from October 15, 2020 to October 22, 2020]

From October 21, operations of the 2nd Cesium Adsorption Apparatus have been suspended.

*1 The figures of the data are treated as a reference, because water levels during water transfer are not stable

*2 The figures of the storage volume do not include those of the following volumes that have accumulated from the bottom of the tanks to the height of so-called "down scale (DS)," where water gauges show 0%:

Freshwater receiving tank (approx. 100m³), Concentrated waste liquid storage tank (approx.100m³), Treated water storage tank (approx. 2,100m³)

Treated values storage tank (captuse toom), Controlmation value alonger tank (captuse toom), Treated values storage tank (normalis storage tank (normalis storage) tank (in the operational limits. *3 The figures of the data show the operational limits. *4 The figures of 'Storage capacity' do not include those of the volumes that have accumulated from the bottom of the tanks to the height of so-called 'down scale (IOS), 'where water gauges show 0%. However, each tank has the capacity that accommodate more than the storage volume that accumulates up to the height of 'DS.'

- *5 The figure of "Residual water" includes the one of the volumes that have accumulated from the bottom of the tanks to the height of so-called "down scale (DS)," where water gauges show 0%. The amount of the residual water of concentrated

saltwater is calculated based on that of the water treated through the ALPS and other facilities. *6 The data shown here are those of Cs-137.

- Total treated amount of Cesium adsorption apparatus and 2nd Cesium adsorption apparatus and 3rd Cesium adsorption apparatus.
- Breakdown of the treated amount: Cesium adsorption apparatus (0m³) 2nd Cesium adsorption apparatus (3,220m³)

3rd Cesium adsorption apparatus (0m3)

- Breakdown of the cumulative treated amount: Cesium adsorption apparatus (394,720m3)
 - 2nd Cesium adsorption apparatus (354,720m) 3rd Cesium adsorption apparatus (1,897,880m³) 3rd Cesium adsorption apparatus (40,880 m³)
- *8 The data of the water levels in the Reactor Buildings are the data as of 5 a.m., October 22 *9 Breakdown of the used vessels: Cesium adsorption apparatus (779), 2nd Cesium adsorption apparatus (240), 3nd Cesium adsorption apparatus (2)
 - Others: Storage container (3,624), Treated column (17), Used vessel (223), Filters and so forth (65)
- *10 Volume of the Strontium-treated water stored in the welded-type tanks
- *11 Volume of the Strontium-treated water remaining in the flange-type tanks *12 Volume of the treated water stored in the welded-type tanks
- *13 Volume of the treated water remaining in the flange-type tanks *14 Volume of the treated water stored in the ALPS sample tanks (flange-type), the additional ALPS temporary storage tanks (welded-type) and the high performance ALPS temporary storage tanks (welded-type)
- *15 Volume of the treated water stored in the reuse welded-type tanks which stored strontium-treated water before (These welded-type tanks have been reused from 2019.)
- *16 Sum of sludge and supernatant water (as of 10 a.m., October 22)

Note The amount of water treated through the 2nd Cesium Adsorption Apparatus is estimated to be 780m³/d (Subject to change depending on the factors such as the levels of water accumulated in T/Bs.) "Accumulated Water Levels in Unit 2, 3 and 4 T/Bs" are simulated water levels in consideration of the change of the water levels caused by recent rainfall, inflow of groundwater, etc. in the surrounding areas of the Fukushima Daiichi Nuclear Power Station. "Accumulated Water Levels in Unit 2, 3 and 4 T/Bs" are simulated water levels which are calculated by adding to the accumulated water amounts which are assumed to increase at the rainfall" are simulated water levels which are calculated by adding to the accumulated water amounts which are assumed to increase at the rainfall equal to the average amount of rain which fell for three months from August to October in 2015 to 2017. - Unit 2 Turbine Building water level is controlled by retained water transfer pumps in the Unit 2 reactor building. - Unit 4 Turbine Building water level is controlled by retained water transfer pumps in the Unit 4 turbine building.
